Sustainable Growth of Asia

Technology innovations have been the drivers of historical, industrial and economic development. The use of primitive tools led to the agricultural revolution, mechanical tools led to the industrial revolution, and now this electronic technology leads to the digital revolution.

Countries that were quick to respond to changes in technology have led the world economy. In particular, Western European and American companies have driven innovation and given birth to a new industry every five decades since the eighteenth century.

In the current digital age, Asia has a golden opportunity to rise as the heart of the global economy. Because in the digital age, all players are placed at the same starting point. And the country and the companies with the highest creativity, intelligence and speed will be the leaders in the digital age.

To be successful, Asian countries and companies should work more closely in science and technology. Standard laws and systems should be developed. Asian countries must not only emphasize on export, but also focus on domestic consumption. And Lastly, in order to increase mutual understanding, we should actively promote the exchange of professors and the students in academia and industries to spur this initiative. Let all of us here take a lead in sharing knowledge and information.
